Introduction

In the document, the first section introduces how to set up the project, and the second section is a list of 50 bugs that we suggest to catch.

Installation and Configuration

Setting up the Server

The following content introduces how to set up the server environment and have the program run.

Step 1: Setting up the Environment

Although the server code works on Windows + Apache + MySQL + PHP (WAMP) environment, we assume to set up a typical environment for PHP: Linux (Ubuntu) + Apache + MySQL + PHP. The necessary components and their versions in this environment are:

Component	Version	Note	Replacement
Ubuntu	13.10	The operating system	 Windows with IIS For older versions of Ubuntu, one needs to get the PHP 5.5.8 or newer package to replace to PHP 5.3 package in Ubunu Precise repository.
PHP	5.5.8	The script engine. Either newest PHP5-MPM package (for Apache) or newest PHP5-FPM package (for Nginx) should work.	None.
Apache	2.4	Server http daemon	Nginx 1.5.8
MySQL	5.6	Database	MySQL 5.5
PHP extensions	-	php5-curl php5-gd php5-intl php-pear php5-imagick php5- imap php5-mcrypt php5-mysql php5-ming php5-ps php5- pspell php5-recode php5-	

snmp php5-tidy php5-xmlrpc php5-xsl	
opcache enabled.	

An article of setting up Ubuntu + Nginx + PHP-FPM + MySQL can be found here: http://xybu.me/setting-up-a-ubuntu-server/

If Microsoft Windows is used, make sure set up smtp configuration correctly to send emails.

Step 2: Getting Source Code

- \$ git clone https://github.com/aoisky/Bonjour # or get code from project coordinator
- 2. Copy the code in server/ to the www root directory of the web server. By default, it is the DocumentRoot in apache's httpd.conf file, or /usr/share/www/html for some versions of Nginx.
- 3. If the server is localhost, make sure http://localhost/ will show the demo html UI, which is a basic UI for the interfaces.
- 4. In the file config.inc.php, modify the \$db_params to contain correct credentials for connecting to the MySQL server.

Step 3: Importing Database Structure

There are three .sql files in db/ directory. In each file, change the SQL server host to the actual host from "localhost", and

- Connect to your MySQL server, log in, and create a dedicate user with limited privilege by importing the code in db/1.mysql_user.sql. A user named "bonjour_demo" with password "demo" is created
- 2. Import the code in db/2.bonjour_demo.sql to create the database bonjour_demo, and the necessary tables.
- 3. Import the code in db/3.grant_priv.sql as all privileges over the table bonjour_demo. Note that this demo user does not have permission over other databases.

Step 4: Basic Check

Register a user with the basic UI on http://localhost/, making sure the
json text with access token is returned; otherwise error connecting to MySQL
server will be shown. PHP extension mysqli.so (on Unix) or php_mysqli.dll
is required.

2. If the token is generated successfully, then password hashing functions are proved to work.

Notes:

We have a defective, super low-performance server (refer to Defect/Server #1) and a main server (also defective, but with higher performance) running. We don't accept stress test for the main server because of the hosting policy. However, volume test and stress test can be easily performed on the low-performance server and reveal problems in the architecture.

Installing Client App

The client app will be packed to the .apk file and can be tested on an Android phone for black box testing. Our testing profile file is Google Nexus 4 on AVD. Using other devices may reveal unexpected issues.

The app source code can be fetched from Github (see Step 2 of previous section). Install the Android plugin for Eclipse to edit it. Create a new Android virtual machine of version >= 4.0 to emulate it. A virtual SD card is necessary to store photos.

Download the ADT Plugin

Start Eclipse, then select Help > Install New Software.

Click Add, in the top-right corner.

In the Add Repository dialog that appears, enter "ADT Plugin" for the Name and the following URL for the Location:

https://dl-ssl.google.com/android/eclipse/

Download the Android SDK

http://developer.android.com/sdk/index.html#download

Notes

Home Activity: This is the homepage of the application after the user sign-in. The homepage will display 3 user profiles. The user profiles should display the name and the hobbies of the users shown. The "More" button currently have no functions. The Manager My Account button will direct the user to the user Profile interface. Currently the user Profile just display a default settings for demo purpose.

List of Suggested Defects

We have listed 18 defects for server side that should be revealed with reasonable effort, and 33 client-side defects.

Server-side Defects

#1	Server has been hosted to a Raspberry Pi device.	Type	Black box	Severity	1		
Output	The server code is hosted on mc18.cs.	he server code is hosted on mc18.cs.purdue.edu cluster, which is a					
before	high-performance server. The virtual host has large memory and high-						
seeding	performance CPU.	performance CPU.					
Output	Raspberry Pi has a 700MHz ARM11 CP	U and 5	12MB me	emory, wh	ich is		
after	significantly lower than mc18 server. T	his diffe	rence in	performai	nce is		
seeding	large enough to fail volume tests and s	tress te	sts.				
Suggested	Use a local computer or virtual host to host the server program, or						
Correction	contact Bonjour team to access the ori	ginal ho	sting.				

#2	User profile can contain code that	Type	Black	Severity	2
	allows for XSS attack.		box		
Output	The function filterHtml in Core class will filter out any HTML or				
before	Javascript code contained in the fields submitted. So the code will be				
seeding	shown as text and will not be executed.				
Output	The user profile fields will have the original	ginal tex	t sent by	the sende	er
after	(including a faker program).				
seeding					
Suggested	In include/Class.Core.php, finish the fil	terHtml	function	to filter o	ut
Correction	special characters like "&" to "&", "	>" to "&g	t;", "<" t	o "< ; ", e	tc.

#3	Array out-of-bound exception if	Type	White	Severity	2
	birthday field does not conform to		box		
	the predefined format.				
Output	When a profile field is named "birthda	ay", prog	gram spli	t the value	with
before	delimiter "-", and the string "MM-dd-YYY	Y" is ma	ade three	parts "MM'	', "dd",
seeding	"YYYY". If the size of the array is not thr	ee, repo	ort error	If any par	t is not
	numerical value, return error. And at la	ast, ched	k if the t	hree fields	form
	a valid date.				
Output	After seeding, the program will not che	eck the a	array size	e, but will s	till
after	assume there are three elements in th	e splitte	d array.	Thus, if the	9
seeding	birthday sent is of format "mm-YYYY", a	ccessing	garray[2	2] will yiel	d
	error.				
Suggested	In action.php, check the size of the sp	litted ar	ray of bi	rthday fie	eld,
Correction	and return error if the size is not 3.				

#4	The sendEmail function is disabled.	Type	Black	Severity	3
			box		
Output	The sendEmail function in Core class is	s a wrap	per of se	everal Linu	Χ
before	sendmail binaries. It will choose a proper one to handle PHP send email				
seeding	requests.				
Output	No email will be sent regardless of the	situatio	n.		
after					
seeding					
Suggested	In the function body of sendEmail, red	irect the	argume	ents to php	built-
Correction	in sendmail function.				

#5	User password allows for length 33.	Туре	White	Severity	3	
			box			
Output	ut Server will check the length of the password, and ensure the length to					
before	be no less than 6 and no more than 32.					
seeding						
Output	Server will allow for a string of length 3	33 as pa	ssword.			
after						
seeding						
Suggested	In class.Core.php, in isValidPasswo	rd funct	ion, char	nge the nu	mber	
Correction	33 to 32.					

#6	Server will reveal debug information.	Туре	White	Severity	1	
			box			
Output	Server will hide all errors, failures, and	other e	xception	s from clie	nt, but	
before	record such problems in server log.					
seeding						
Output	Server will print all errors directly to st	derr, wh	ich is act	tually the		
after	browser or HTTP requester. For a proc	duction b	oranch th	nis is dang	erous	
seeding	and will be a serious mistake.					
Suggested	Turn off debug mode in config.inc.p	hp.	•			
Correction						

#7	When database server can't be	Туре	Black	Severity	1
	connected, the user credentials for		box		
	the database will be revealed.				
Output	If such connection failure happens, error will be written to				
before	php_error.log, and the execution is to	erminat	ed, leavir	ng the pag	e
seeding	blank.				
Output	The connection failure will be printed directly on the page, including the				
after	database host and port number, userr	name, ar	nd passw	ord, and t	he

seeding	database name.
Suggested	In function connect() of class.Database.php, change the code when
Correction	the database object is not instantiated to die() directly, instead of
	printing the details.

#8	Server always returns a list of users	Туре	Black	Severity	2
	who are in the default range of		box		
	distance to the requester.				
Output	Client will send a parameter indicating the desired range, and server				
before	searches in the database for those wh	o are in	such ran	ige.	
seeding					
Output	The desired range parameter is ignore	d by the	server;	server will	
after	always search for users within the defa	ault valu	e of rang	ge.	
seeding					
Suggested	Use the desired range parameter giver	n by the	request	er to overv	vrite
Correction	the value of the range variable in acti	on.php.			

#9	Server does not distinguish user	Туре	Black	Severity	3		
	email and username parameters.		box				
Output	Server strictly distinguishes usernames	Server strictly distinguishes usernames from user emails because they					
before	have different format requirements.						
seeding							
Output	If one searches for an email address b	ut gives	a userna	me in that	t field,		
after	server will return the user whose user	name m	atches th	nat value.			
seeding							
Suggested	Change all the combined checks in class. User. php so these two						
Correction	parameters can be checked individuall	у.					

#10	Password retrieval token never	Type	White	Severity	2
	expires.		box		
Output	The password retrieval token expires i	n one d	ay.		
before					
seeding					
Output	The password retrieval token will neve	r expire	because	it is hash	ed with
after	base seed being username. i.e., as long	g as the	usernan	ne does no	ot
seeding	change, the token will not expire. Attac	kers ca	n retrieve	e such tok	ens
	and usernames to conduct attacks.				
Suggested	Change the hash base to user_lastActiv	veTime	or other	volatile or	
Correction	frequently changed fields.				

#11	User access token does not expire	Type	White	Severity	2	
	unless the user logs out.		box			

Output	The user access token automatically expires if the last active time is a
before	time older than one month.
seeding	
Output	User access token is always valid unless the user logs out when the last
after	active time, which is the base of tha hash, is refreshed.
seeding	
Suggested	In class.User.php, add check for time difference bewtween now() and
Correction	user_lastActiveTime which returns false when such value is larger
	than 30 (days).

#12	The original message or error	Type	Black	Severity	3
	prompt, is written in a relatively		box		
	vague way from user's perspective.				
Output	The message will contain the error rea	son and	possible	e fix.	
before					
seeding					
Output	The message is mostly vague error rea	ison, wh	ich depe	nds on the	e client
after	to parse to user-friendly sentences.				
seeding					
Suggested	Rewrite all error messages in User clas	s and a	ction.ph	ıp.	
Correction					

#13	The error messages are loosely	Туре	White	Severity	3
#15	written in the script and are hard to	Турс	box	Jevenity	
	•		DUX		
	maintain.				
Output	There is a class that handles parsing a	2-tuple	of error	event and	error
before	number to an error message.				
seeding					
Output	The class is removed and all its access	es are re	eplaced v	vith very b	riefly
after	rewritten sentences. This causes sever	e maint	enability	issue whe	n the
seeding	set of defined errors gets increasingly	large.			
Suggested	 Remake such Dictionary class 	and ins	tantiate i	t in Core.	
Correction	2) Let Core fetch the error messag	ge from	Diction	ary instead	d of
	getting messages as hard-code	d param	eters.		
#14	When the matching list of users is	Туре	Black	Severity	1
	long, the response will be extremely		box		
	long with the information of all				
	matching users included.				
Output	Before the bug injection, only at most	20 users	ordered	d by last ac	tive
before	time are listed in the response. Also or	nly the e	mail field	d of the us	ers is
seeding	revealed.				
Output	By listing all matching users and includ	ding all t	heir prof	iles, the	

after	response will be very large and is likely to cause network issue on
seeding	mobile network, and the cliently may halt rendering the list. Also the
	user information is leaked.
Suggested	Change the SQL query in getMatching function in User class so that:
Correction	 Limit the maximum number of matches (records)
	Fetch only the user_email column

#15	Because of the small storage on the main server, file uploading is actually forbidden.	Type	White box	Severity	2
Output	The FileUploadHandler class will stor	e files in	files d	irectory.	
before					
seeding					
Output	All the entries related to file uploading	are ma	de to em	pty stubs.	
after					
seeding					
Suggested	Instantiate FileUploadHandler class in	n the en	npty entr	ies.	
Correction					

#16	Attackers can try to brute-force the user password because there is no ceiling for the number of password failures.	Туре	Black box	Severity	1	
Output	When the password is typed wrong for be locked for 24 hours.	r five tim	nes, the ι	ıser accou	nt will	
before seeding	be locked for 24 flours.					
Output	The user can try unlimited times to find	d the co	rrect pas	sword by	brute-	
after	force.					
seeding						
Suggested	Re-add the user_locked field in datab	ase, and	l add a cl	hecker tha	t	
Correction	 When the user tries wrong pass 		ecord thi	s user in P	ΉP	
	session, setting the value to be					
	 Every time the user tries a wror 	• .			s value	
	When the number reaches 5, lo		-	•		
	user_locked for the user recor				-	
	and forbid accessing this account until user_locked is an older					
	timestamp compared to now().					

#17	Server will not forbid flood requests.	Туре	Black	Severity	1
			box		
Output	Before this change, the main server will be able to detect abnormally				
before	frequent requests and forbid the reque	ester for	a period	l of time, tl	hus

seeding	protecting the server from DDoS attacks.
Output	The protection is removed, so the server will try its best to serve every
after	request it receives. Because there is no ceiling for the number of
seeding	requests a user can send in a period of time, server will suffer from
	DDoS attacks and thus fail stress test.
Suggested	The way to enable such server-wide check for flood requests is included
Correction	in the article about setting up server.

#18	There is no built-in caching	Туре	White	Severity	3	
	mechanism in the code at all.		box			
Output	We did have some caching mechanism	in Data	base cla	ss, which o	aches	
before	the queries according to their types.					
seeding	We also use opcache to cache the bina	We also use opcache to cache the binary code of php.				
Output	When the server load is low, there is no obvious difference in					
after	performance, but as the size of databa	ise and i	the comp	olexity and		
seeding	frequency of queries grow, the perforr	mance p	unishme	ent for not	having	
	a cache will be very obvious.					
Suggested	It is so atypical that a server side code	does no	t any cao	ching		
Correction	mechanism. With cache extension like	php5_a _l	ocu, build	d some cad	hing	
	reasonable mechanisms in Database c	lass.				
	The severity level is 1 when the load is he	avy.				

Client-side Defects

#1	The passwords sent by client are not encrypted.	Type	Black	Severity	1
Output	The password was encrypted before sending so that even if a hacker				
before	gets the HTTP packets, the data is mostly useless to him.				
seeding					
Output	In HTTP POST data of events like login	In HTTP POST data of events like login or registration, the original			
after	password will show up. E.g., if the password is "123456", there will be a				
seeding	field like "password=123456".				
Suggested	In APIHandler class, add md5 encryptic	n to the	related	functions	like
Correction	login or register.				

#2	The ListView in home activity cannot be displayed correctly	Type	Black	Severity	1
Output before	The ListView should be displaying the	user icoi	n and sev	veral user	info
seeding					
Output	The ListView display nothing				
after					
seeding					

Suggested	Modifying the home activity class, adding adapter
Correction	

#3	The server shutdown caused client	Type	Black	Severity	1	
	response string to null and handle		box			
	the string incorrectly					
Output	When the server shutdown, the null value of the response string is					
before	correctly handled and a login error me	ssage sl	nowed o	n the scree	en	
seeding						
Output	When the server shutdown, the null va	lue caus	sed NullF	ointerExc	eption	
after	and ignored by the client.					
seeding						
Suggested	Add the correct null value check before	e access	ing the r	esponse s	tring	
Correction						

#4	The network availability is not checked by the client, if a network is not available, it will cause the crash of the app.	Туре	Black box	Severity	1
Output	If the network is not available, the clier	nt will pr	ompt th	e message	and
before	login or register cannot be executed.				
seeding					
Output	If the network is not available, the clier	nt will st	ill try to a	access the	
after	network and cause the client crashed.				
seeding					
Suggested	Use the network availability method to	check t	he netwo	ork before	trying
Correction	to access the network.				

#5	In ListView layout, the TextView displaying details of hobbies may overlap with the User Image if the list of hobbies are too long.	Туре	Black box	Severity	3
Output before seeding	The hobbies should not overlap with the	he user	lcon		
Output after seeding	The hobbies overlap with the user lcor	n if it is t	oo long		
Suggested Correction	Modify the position of TextView of hob	bies			

#6	The line overlapped with the top of	Type	Black	Severity	3	
----	-------------------------------------	------	-------	----------	---	--

	ListView.	box	
Output before seeding	Overlapping should not be happening		
Output after seeding	Overlapping happened		
Suggested Correction	"android:layout_below="@+id/textView	Line"	

#7	The button will disappeared if the	Туре	Black	Severity	2	
	username is too long		box			
Output	The button should not disappear if the username is too long. It will					
before	overlap with the username.					
seeding						
Output	The button is being pushed out of the	bounda	ry due to	the wron	g align.	
after						
seeding						
Suggested	Modified android:layout_marginRight=	-"21dp"	•			
Correction						

#8	The ListView cannot display the last	Type	Black	Severity	1
	item correctly		box		
Output	The ListView should display the same contents for every items.				
before					
seeding					
Output	Some contents is being cut-off due to t	the size	of ListVie	ew.	
after					
seeding					
Suggested	Modify the size(width, height) of the Lis	stView			
Correction					

#9	The orientation of the signupActivity does not change to the horizontal when the orientation of the phone change to the horizontal	Туре	Black box	Severity	3
Output before seeding	The signupActivity changed to the hori to the horizontal.	zontal w	hen the	phone cha	anged
Output after seeding	The signupActivity does not change the changed to the horizontal.	e directi	on when	the phone	9

Suggested	Add the code to handle the orientation changes.
Correction	

#10	In ListView layout, the TextView displaying details of hobbies may overlap with the User Image if the list of hobbies are too long.	Type	Black box/ White board	Severity	2
Output before seeding	They should not be overlapping and sh	nould be	displaye	ed correctl	y
Output after seeding	They are overlapped with each other				
Suggested Correction	Modified by using align.				

#11	In the Sign Up Upload Fragment, when no image on the phone, the app does not have error message shows up	Туре	Black box	Severity	3
Output before seeding	If no image on the phone, a message to user to upload some photos to the photos		ıld show	up and te	ll the
Output after seeding	If no image on the phone, nothing will cannot be finished.	show uր	and sig	nup activit	Ty .
Suggested Correction	Add a method to show up a message there is no image on the phone.	oox in th	ie signup	fragment	when

#12	The home_activity is not displaying	Type	Black	Severity	1
	the correct user information		box		
Output	The home_activity should be able to display the username and hobbies.				obbies.
before					
seeding					
Output	The home_activity just display the defa	ault outp	out.		
after					
seeding					
Suggested	Should implement the home_activity_l	ist_class	java to g	get and sto	re the
Correction	necessary data.				

#13	The signup fragment does not check	Type	Black	Severity	2	
	the validity of the email address		box			

Output	If the email is in the incorrect form, an error message will show up.
before	
seeding	
Output	If the email is in the incorrect form, no error message will show up and
after	the client will send the incorrect user email information to the server.
seeding	
Suggested	Add the email validity check before sending the information to the
Correction	server.

#14	The signup fragment does not check	Туре	Black	Severity	3
	the age of the user		box		
Output	The signup fragment will show up an e	error me	ssage wl	nen the us	er age
before	is in the incorrect form				
seeding					
Output	The signup fragment will not show up	any erro	or and in	correct use	er age
after	will send to the server.				
seeding					
Suggested	Add the age validity check before send	ling the	informat	ion to the	server.
Correction					

#15	The signup fragment does not check whether the retyped password equals to the password	Type	Black box	Severity	2
Output	If the password is not equal to the retyped password, an error message				
before	will show up				
seeding					
Output	If the password is not equal to the rety	ped pas	ssword, r	no error m	essage
after	will show up				
seeding					
Suggested	Check the equivalence with the passwo	ord and	the rety	oed passw	ord
Correction					

#16	The default userIcon should be	Туре	Black	Severity	3
	bonjour_icon.bmp		box		
Output	The default userlcon is bonjour_icon.b	mp			
before					
seeding					
Output	The default userIron is wrongly set to i	nouser.j	pg		
after					
seeding					
Suggested	Modify the reference to bonjour_icon.l	omp			·
Correction					

#17	The signup fragment does not check	Type	Black	Severity	2	
	if the gender is set or not		box			
Output	If no gender is chosen, an error messa	If no gender is chosen, an error message will show up and the user				
before	cannot click the register the account b	utton				
seeding						
Output	If no gender is chosen, no error messa	ge will s	how up	and the us	er can	
after	click the register button and cause the	client ci	rashed			
seeding						
Suggested	Check the validity of gender	·				
Correction						

#18	The signup fragment does not check	Туре	Black	Severity	2
	whether the retyped password		box		
	equals to the password				
Output	If the password is not equal to the retyped password, an error message				
before	will show up				
seeding					
Output	If the password is not equal to the rety	ped pas	sword, r	no error m	essage
after	will show up				
seeding					
Suggested	Check the equivalence with the passwo	ord and	the retyr	oed passw	ord
Correction					

#19	In the SQLHandler getAllFriendsByUserId method, the cursor is not moved to the first, so data can be obtained from this method	Туре	White box	Severity	2
Output	The getAllFriendsByUserId method car	n return	correct i	nformatio	n from
before	the database.				
seeding					
Output	The getAllFriendsByUserId method car	nnot reti	urn the c	orrect	
after	information.				
seeding					
Suggested	Move the cursor object to the first enti	ry.			
Correction					

#20	HomeListLayoutActivity.java is not	Type	White	Severity	3
	doing anything and has no uses		box		
Output	This class should be removed after modifying the the implementation				
before	of HomeActivity.class				

seeding	
Output	This class is not being removed
after	
seeding	
Suggested	Remove the class
Correction	

#21	The SQLHandler. addFriend method	Туре	White	Severity	3
	does not check the Bundle is null or		box		
	not				
Output	If a null value passed to the addFriend	method	d, it will n	ot be exec	uted
before					
seeding					
Output	A null value is not checked and will cau	ise a Nu	llPointer	Exception	when
after	a null value passed to this method.				
seeding					
Suggested	Check the null value before accessing i	it			
Correction					

#22	SQLHandler.addFriend method needs a writable database, but it	Type	White box	Severity	2
	obtains a readable database				
Output	The method will correctly add the frier	nd to the	databas	se	
before					
seeding					
Output	The method cannot add the friend to t	he data	base and	cause the	crash
after	of the app				
seeding					
Suggested	Change the readable database to write	able data	abase.		
Correction					

#23	Some of the content may not be	Туре	Black	Severity	3
	displayed correctly in other devices		box		
Output	The display should support most of the	e device	S		
before					
seeding					
Output	Half of the button at the bottom of log	in interf	ace is no	t displaye	d in
after	320x480 resolution				
seeding					
Suggested	Modify the layout to make it support a	s many	devices a	as possible	!
Correction					

#24	SQLHandler. setUserAccessToken uses an integer value to represent a user id, but a user id can be a long value	Type	White box	Severity	3
Output before	If a user id is larger than an integer value, it will update the database correctly				
seeding					
Output	If a user id is larger than an integer val	ue, it ca	uses an o	overflow a	nd
after	incorrect value will be inserted to the o	database	2.		
seeding					
Suggested	Change the userId parameter to the lo	ng type			
Correction					

#25	The coding in HomeActivity.java is	Туре	White	Severity	3
	messy and is hard for maintenance		box		
Output	The code should be organized well.				
before					
seeding					
Output	The code is messy and hard to mainta	in.			
after					
seeding					
Suggested	Re-organize the code.				
Correction					

#26	SQLHandler. getUserAccessToken method uses an integer to represent the userId, but a user id can be a long value	Туре	White box	Severity	3
Output	If a user id is larger than an integer value, it will update the database				
before	correctly.				
seeding					
Output	If a user id is larger than an integer val	ue, it ca	uses an o	overflow a	nd
after	incorrect value will be inserted to the o	databas	e.		
seeding					
Suggested	Change the userId parameter to the lo	ng type			
Correction					

#27	SQLHandler. getUserNameByUserId	Type	White	Severity	2
	method should obtain a readable		box		
	database, but a writable database is				
	obtained.				

Output	The method will obtain the username correctly by the user id.
before	
seeding	
Output	The method cannot obtain the correct username and sometimes
after	causes a crash.
seeding	
Suggested	Obtain a readable database instead of a writable database.
Correction	

#28	In LoginActivity class, it checks if the length of the password less than 4, but the password should contain at least 6 characters	Туре	White box	Severity	2
Output before seeding	If the password is less than 6, an error	messag	ge will sh	ow up	
Output after seeding	If the password is less than 4, an error length of a password is 5 characters, it message.	_		•	
Suggested Correction	Change the checking condition to the	5			

#29	In the signup activity, the age field	Туре	Black	Severity	3
	does not restrict the length of the		box		
	field				
Output	If the age field contains more than thre	ee chara	cters, it v	will restrict	t the
before	text field and no more character can b	e inputt	ed to the	field.	
seeding					
Output	Any length of the age can be typed into	o the tex	kt field.		
after					
seeding					
Suggested	Write the condition to check the length	of the	age text	field.	
Correction					

#30	SQLHandler.addUser cannot insert	Туре	White	Severity	3
	the url encoded username to the		box		
	database				
Output	The username and password should b	e decod	led befor	e inserted	into
before	the database.				
seeding					
Output	Encoded username and password are	trying to	o insert ii	nto the da	tabase
after	and cause the Database exceptions				

seeding	
Suggested	Decode the username and password before inserting into the
Correction	database.

#31	SQLHandler.addUser does not add	Type	White box	Severity	2
	quotes between a query string and		DOX		
	causes a SQL syntax problem				
Output	A user should be added to the database correctly.				
before					
seeding					
Output	The email address contains a '@' symbol and causes a syntax problem				
after	of the SQL.				
seeding					
Suggested	Add quotes to the query string.				
Correction					

#32	The button "Manage my account"	Туре	White/	Severity	2
	does not direct to user Profile		Black		
	interface		box		
Output	The Manage should be direct to the user Profile interface				
before					
seeding					
Output	The button is not connected to the us	er profil	е		
after					
seeding					
Suggested	Add "intend" in order to direct from h	ome_act	tivity to us	ser Profile	
Correction	interface				

#33	In Home_activity_list_class, the	Туре	White	Severity	3
	setHobbies function is useless		box		
Output	The class is for storing the data that will be used in ListView in				
before	HomeActivity. It should not have the function setHobbies to change the				
seeding	hobbies.				
Output	The function is implemented in the cla	SS.			
after					
seeding					
Suggested	Remove the function.			•
